

Sales Analysis Dashboard

Project Overview & Executive Summary

Project Overview

The Sales Analysis Dashboard is an interactive Excel-based business intelligence dashboard developed to analyze order performance, revenue generation, customer spending, delivery efficiency, product performance, occasions, cities, and sales trends over time. The dashboard converts raw sales/order data into meaningful visual insights using PivotTables, PivotCharts, Slicers, and KPI cards. It enables management and business users to quickly understand sales performance and identify areas that require attention.

Key Performance Indicators

Metric	Value
Total Orders	1,000
Total Revenue	₹35,20,984
Average Order-to-Delivery Time	5.53 days
Average Customer Spend	₹3,520.98

Key Business Insights

1. Revenue by Occasion

The dashboard compares revenue generated across Anniversary, Birthday, Diwali, Holi, Raksha Bandhan, Valentine's Day, and other occasions. Anniversary appears to be one of the strongest revenue-generating occasions, while Diwali and Valentine's Day also contribute significantly. This indicates that occasion-based campaigns can play an important role in driving sales.

2. Revenue by Product Category

The category analysis includes Cake, Colors, Mugs, Plants, Raksha Bandhan, Soft Toys, and Sweets. Colors, Soft Toys, and Sweets show strong revenue contribution compared with several other categories. This can help the business prioritize high-performing categories for inventory planning and marketing campaigns.

3. Top Cities by Orders

The dashboard identifies cities with the highest number of orders. Cities such as Imphal, Dhanbad, Kavali, and Hardwar appear among the stronger-performing locations. This analysis can help management identify high-demand markets and develop location-specific marketing and sales strategies.

4. Monthly Revenue Trend

The monthly trend shows noticeable variations in revenue throughout the year. Revenue peaks are visible around February and August, while some months show significantly lower sales. This indicates that sales are influenced by seasonal and occasion-based demand.

5. Top 5 Products by Revenue

The dashboard highlights the top-performing products based on revenue. Products such as Magnam Set, Quia Gift, Dolores Gift, and Harum Pack are among the leading products in the displayed analysis. These products can be considered for additional promotion, cross-selling, and inventory prioritization.

6. Revenue by Order Time

The hourly revenue analysis shows how revenue varies throughout the day. The business can use this information to identify high-performing ordering hours and optimize promotional activities, customer support, and operational resources during peak periods.

Business Recommendations

1. Focus on high-performing occasions

Prepare targeted campaigns before high-revenue occasions such as Anniversary, Diwali, and Valentine's Day.

2. Promote high-revenue categories

Give greater marketing attention and sufficient inventory allocation to strong categories such as Colors, Soft Toys, and Sweets.

3. Target high-order cities

Focus regional marketing campaigns on cities generating higher order volumes and investigate opportunities in lower-performing cities.

4. Prepare for seasonal peaks

Use monthly revenue patterns to plan inventory, staffing, marketing budgets, and promotional activity before expected peak periods.

5. Improve delivery efficiency

Monitor the current average order-to-delivery time of 5.53 days, identify delays, and improve delivery operations to support customer satisfaction.

6. Increase customer spending

Use product bundles, cross-selling, premium products, personalized recommendations, and occasion packages to increase revenue per customer.

Conclusion

The Sales Analysis Dashboard provides a centralized and interactive view of business performance. It allows users to analyze 1,000 orders generating ₹35.21 lakh in revenue, while also monitoring customer spending and delivery efficiency. The dashboard demonstrates that occasion-based demand, product categories, geographic location, seasonality, and ordering time are important factors influencing sales performance. By using these insights, management can make data-driven decisions related to marketing, inventory, customer targeting, delivery operations, and revenue growth. Overall, the dashboard transforms raw sales data into actionable business intelligence and provides a strong foundation for performance monitoring and strategic decision-making.
